

WebSafe, Inc. Announces Release of the MyMedSafe Feature

BIRMINGHAM, AL (June 27, 2006) - *WebSafe*, a provider of a secure Internet based filing system that offers the ability to store personal medical information for retrieval in emergency situations, today announced the addition of the **MyMedSafe** feature. Vital medical information will be made available anywhere, at anytime, to the customer and authorized individuals. Natural disasters, such as hurricane Katrina, have spurred demand for solutions that preserve important data and make it accessible during emergencies.

WebSafe customers, who use MyMedSafe, are given an emergency retrieval code to carry in their wallet which allows access to their medical information. Immunizations, allergies, personal medical history, emergency contacts, health care directives, etc. can be obtained instantly using any computer with Internet access.

"MyMedSafe is a valuable new feature of *WebSafe* which guides the user through entry of important medical information" said Donald B. Moore, WebSafe's Director of Business Development. "MyMedSafe will be the first of several new specialized content features available through the *WebSafe* solution. By the end of the summer, we plan on introducing MyWealthSafe to subscribers with content provided by Stewart H. Welch, III, a noted financial planner and author. We believe that consumers will benefit from *WebSafe's* secure encrypted storage coupled with the content we provide. "

About Websafe, Inc.

Customers use *WebSafe* to store important information such as scanned images, word processing documents, spreadsheets, etc. on secure servers located at Southern Telecom, a wholly owned subsidiary of Southern Company (NYSE:SO). Users can access their WebSafe via an Internet connection from anywhere in the world. To insure the highest level of security, *WebSafe* encrypts all information both in transit and while stored. "Keys" can be given to family members and advisors, allowing specified folders to be shared. *WebSafe* also offers the ability to automatically backup critical data on a scheduled basis into the Customer's safe.
